SOLID MILLING TOOLS

DIA  **EDGE**

NEW

MITSUBISHI MATERIALS

INTRODUCING THE NEW GENERAL CATALOGUE C009 – 2022/2023

TARGETED, COMPACT, HANDY.

Mitsubishi Materials' wide product portfolio is now shown in catalogues that represent individual application areas, offering users fast and easy access to targeted product information.

There is now a set of catalogues in small, practical sizes comprised of the following five volumes:

- **TURNING TOOLS**
- **DRILLING TOOLS**
- **SOLID MILLING TOOLS**
- **INDEXABLE MILLING TOOLS**
- **MPLUS**

NEW DESIGN

EASY HANDLING

HIGHER FLEXIBILITY

INDIVIDUAL APPLICATION AREAS

The slipcase provided enables easy storage and offers the required space for all future catalogues, including the product news brochures that will be published within the 2-year life cycle of the catalogue. Each new product news brochure published within the 2-year cycle will completely replace the previous version. Therefore, please dispose of old versions when new ones are supplied to ensure that the collection is up to date.

NOTES:

- With this publication, all previous general catalogues and product news brochures lose their validity.
- The product news catalogues are released twice a year, in April and October.
- The new general catalogue can be ordered only as a set of five. **Order number: C009E**

DIGITAL VERSION

For the digital version of the catalogue, please scan the QR code or visit us at www.mhg-mediastore.net

SOLID MILLING TOOLS

INNOVATION – THE KEY TO CONTINUOUS GROWTH

Mitsubishi's wide range of milling products provides off the shelf or tailor-made solutions, whether for the automotive, aerospace and medical or general machining industries.

From the smallest cutter in the mini end mill series to the ceramic CE-series, Mitsubishi Materials provides targeted, innovative, high quality products.

DIA EDGE

CREATE A
BETTER FUTURE
TOGETHER WITH OUR
CUSTOMERS

Announcing DIAEDGE, our new brand of tools that brings together cutting-edge technologies, exciting all who use them.

The aim is not only to offer value with our tools, but to think together with customers, share inspiration and continue to take on new challenges.

SYMBOL DESCRIPTIONS

Tool material

Ultra micro grain carbide

Ultra micro grain carbide is used as the substrate material.

Cubic boron nitride

Mitsubishi's original CBN is used.

Ceramic

Ceramic is used as the substrate material.

High hardness powder metallurgy HSS

High hardness powder metallurgy HSS is used as the substrate material.

Tolerances

Outside diameter tolerance

Indicates the diameter tolerance of the end mill.

R tolerance

Indicates the radial tolerance of a ball nose end mill.

R tolerance

Indicates the radial tolerance of an end mill with a corner radius.

Tolerance of Taper angle

Indicates the tolerance of the taper angle.

Tolerance of Point diameter

Indicates the tolerance of the point diameter.

Shank diameter tolerance

Indicates the shank diameter tolerance.

Angle, coolant hole, sharp corner edge and gash land

Helix angle

Indicates the helix angle of the end mill.

End cutting edge with coolant hole

Peripheral cutting edge with coolant hole

Sharp corner edge

Indicates the end mill has a sharp corner edge.

Gash land

Indicates the end mill cutting edge with protection chamfer.

Coating

SMART MIRACLE Coating

(Al, Cr)N coating optimum for stainless and difficult-to-cut materials.

VQT Coating

(Al, Cr)N coating optimum for Ti-alloys

VQN Coating

(Al, Ti, Si)N coating optimum for Ni-based alloys

VFR Coating

The (Al, Cr, Si)N / (Al, Ti, Si)n PVD multilayer Coating is ideal for machining extremely hard steels up to 70HRC.

IMPACT MIRACLE Coating

Single phase nano crystal coating technology for higher film hardness and heat resistance.

(Al,Ti,Cr)N multilayer coating

Higher versatility, for drilling carbon steel, alloy steel and hardened steel.

(Al, Ti)N Coating

(Al,Ti)N offers higher versatility.

CRN Coating

Newly developed CrN coating for Copper Electrodes machining.

DLC Coating

Hardness similar to that of CVD diamond coating achieved with high adhesion strength.

CVD Diamond Coating

Suitable for CFRP and CFRP-Aluminium materials.

CVD Diamond Coating

High performance coating for hard brittle materials excelling in film adhesion to the substrate.

Diamond Coating

Suitable for graphite machining.

Violet Coating

The original Miracle (Al, Ti)N coating achieves longer tool life.

Work application range

The recommendations for work materials in the TOOL NAVI section are demonstrated as follows:

The upper line shows the first recommendations.

The lower line shows the second recommendations.

1st Recommendation

2nd Recommendation

COATING TECHNOLOGY

VFR **IMPACT MIRACLE REVOLUTION Coating**

The combination of the (Al, Cr, Si) N coating (newly-developed), which has a high oxidation temperature and high lubricity, together with the (Al, Ti, Si) N coating, which has better wear resistance and high adhesion, allows reliable hardened steel machining.

SOLID END MILLS

- (Al,Cr,Si)N**
 - ★ High Oxidation Temperature
 - ★ High Lubricity
- (Al,Ti,Si)N**
 - ★ Better Wear Resistance
 - ★ High Adhesion
- Ultra Micro-grain Cemented Carbide**

VF **IMPACT MIRACLE Coating**

Faster cutting speeds and longer tool life for high hardness materials and heat resistant alloys.

In comparison with conventional coatings, single-phase nano crystal coating technology offers higher coating hardness and heat resistance. When machining hardened steels IMPACT MIRACLE coating offers a lower coefficient of friction and helps prevent abnormal damage such as chipping.

FEATURES OF IMPACT MIRACLE COATING

	IMPACT MIRACLE Single phase nano coating (Al,Ti,Si)N	(Al,Ti,Si)N	(Al,Ti)N
Hardness (HV)	3700	3200	2800
Oxidation Temperature (°C)	1300	1100	840
Adhesion (N) ¹⁾	100	80	80
Wear Coefficient ²⁾ (800°C)	0.48	0.53	0.58

1) Adhesion : Measured by critical load scratch test.
2) Coefficient of friction : Measured by ball-on-disk method.
(Counter gear : W.-nr. 1.2379(D2) 60HRC)

MS+ **(Al,Ti,Cr)N multilayer coating (MS Plus)**

MS plus provides long tool life on materials up to 52 HRC.

Greatly improved wear resistance even when machining hardened materials.

Properties of (Al,Ti,Cr)N multilayer coating (MS Plus)

	(Al,Ti,Cr)N multilayer	(Al,Ti)N	(Al,Cr)N
Hardness (HV)	3200	2800	3100
Oxidation Temperature (°C)	1100	800	1100
Adhesion (N)	100	80	80

VQ Coating

These end mills have been treated with a newly developed (Al, Cr)N group coating which delivers substantially better wear resistance. The surface of the coating has been given a smoothening treatment resulting in better machined surfaces, reduced cutting resistance and improved chip discharge. This is the next generation of coated end mills that delivers long tool life when machining stainless steel and other difficult-to-cut materials.

Smoothed surface "ZERO- μ Surface"

Newly developed (Al, Cr)N group coating

Super-fine-particle, super-hard base material

ZERO- μ Surface

ZERO- μ Surface

With the unique ZERO- μ Surface, the cutting edge retains its sharpness. While previous technologies often resulted in diminished sharpness, the ZERO- μ Surface achieves both smoothness and sharpness, as well as longer tool life.

SMART MIRACLE coating

SOLID END MILLS

CRN Coating

Specially designed for milling copper electrodes and copper alloys.

CRN coating has been developed for copper alloy milling. It has superior wear resistance and excellent adhesion strength by using Miracle coating technology. The excellent anti adhesion properties needed for copper machining has been achieved due to its low coefficient of friction at high temperatures.

DLC Coating

For milling of aluminium alloys at high speed.

Hardness similar to that of CVD diamond coating achieved but with high adhesion strength.

Mitsubishi Materials and NAGATA SEIKI have jointly developed a unique DLC coating that has substantially increased "adhesion strength" compared to previous DLC coatings.

DFC Diamond Coating

Proprietary CVD diamond coating produces excellent wear resistance and smooth hole surface.

The newly developed CVD diamond coated carbide material achieves outstanding abrasion resistance and smoothness due to a proprietary fine multilayer diamond crystal control technology.

DF Diamond Coating

Diamond coating for graphite and non-ferrous materials.

Owing to Mitsubishi's unique plasma chemical vapor deposition (CVD) coating technology, the diamond coating is affixed firmly to the substrate to ensure long tool life and prevent peeling. DF end mill series suitable for graphite machining.

VIOLET Coating

(Al,Ti)N coating, excellent adhesion strength for HSS tools.

Violet coating is the name of the technology of successfully that can apply a Miracle type coating to HSS substrate tools. Mitsubishi's unique technology of applying (Al,Ti)N coating at the low temperatures required for HSS substrates, means that Violet coating has the same level of adhesion strength as Miracle coating. Additionally, high film hardness and excellent oxidation resistance properties have also been realised.

16	2400	380	3.00	1200	100	0.80
20	1900	320	4.00	1000	80	1.00

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) When slotting with end mills of $\phi 3$ or larger, reduce the revolution by 30—50% and the feed rate by 40—60%.

Note 3) When drilling, please set the feed rate at 1/3 or below the values above.

Note 4) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

20	1600	500	1000	240	640	120	290	25

Depth of cut	$\leq 1DC$ ($DC \geq \phi 2$) $\leq 0.5DC$ ($DC < \phi 2$)		
			DC: Dia.

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut										

DC: Dia.

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut

DC: Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Cutting conditions may be considerably different due to the overhang (milling depth), depth of cut, and machine tool. Please see the above table as a standard.

8	8000	1000	0.80	5600	550	0.40
10	6400	900	1.00	4500	500	0.50
12	5400	820	1.00	3800	450	0.50

Depth of cut

DC: Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) When slotting with end mills of $\phi 3$ or larger, reduce the revolution by 30—50% and the feed rate by 40—60%.

Note 3) When drilling, please set the feed rate at 1/3 or below the values above.

Note 4) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- Note 1) α is the inclination angle of the machined surface.
- Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.
- Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.
- Note 4) Standard cutting conditions of austenitic stainless steel and titanium alloy, please reduce the revolution by 40% and the feedrate by 55%.
(Hardened steel (45–55HRC) table above)

MP2SDB

Ball nose, Short cut length, High strength, 2 flute

CARBIDE

Note 4) Cutting conditions may differ considerably due to the overhang, depth of cut and machine tool condition. Please use the table above as a reference starting point.

Note 5) For hardened steel over 55HRC, use VF2XLB.

Note 6) For cutting conditions for austenitic stainless steel and titanium alloy, use the high hardness steel (45-55HRC) table but reduce the spindle speed by 40% and the feed rate by 55%.

Depth of cut															

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

MPSHV/W

End mill, Short cut length, 2.5 x DC neck recess

20	2400	1200	34	4	1900	840	34	4	1600	670	34	4	1100	260	34	1															

Note 1) Wet cutting mode is recommended for cutting stainless steels and titanium alloys, and air blow is recommended for carbon steels.
 Note 2) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) When drilling, please set the feed rate at 1/3 or below the values above.

Note 4) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

RE:Radius

Note 1) α is the inclination angle of the machined surface.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut

RE:Radius

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Cutting condition may be considerably different due to the overhang (milling depth), depth of cut and type of machine tool.

Please use the above table as a standard.

Depth of cut

RE:Radius

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

--------------	--	--	--	--

DC: Dia.

Note 1) When slotting, reduce the revolutions by 50–70% and the feed rate by 40–60%.

Note 2) For austenitic stainless steels, titanium and heat-resistant alloys, VQMHV type is recommended.

Note 3) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut	<p>Please refer to the list above for depth of cut. ≤1.5DC</p>	<p>Please refer to the list above for depth of cut. ≤1.0DC</p>
	DC: Dia.	

Slot milling with small diameter tools

Work material	H					
	Hardened steel (45–55HRC)			Hardened steel (55–62HRC)		
	X40CrMoV51			X210Cr12		
Dia. DC (mm)	Revolution (min ⁻¹)	Feed rate (mm/min)	Depth of cut (mm)	Revolution (min ⁻¹)	Feed rate (mm/min)	Depth of cut (mm)
1	15000	300	0.1	9500	110	0.05
2	8000	320	0.2	4800	190	0.1

Depth of cut	<p>Please refer to the list above for depth of cut.</p>
	DC: Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Air blow or oil mist is recommended for good chip evacuation.

Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.

Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.
 Note 2) Air blow or oil mist is recommended for good chip evacuation.
 Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
 Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

High depth of cut conditions

Where - is shown, please refer to high speed cutting conditions on page I155.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Air blow or oil mist is recommended for good chip evacuation.

Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.

Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VFHVRB

Depth of cut																			

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Air blow or oil mist is recommended for good chip evacuation.

Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.

Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Note 1) α is the inclination angle of the machined surface.

Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased. Please reduce the feed rate when the surface finish is important.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and the feed rate proportionately.

Depth of cut

Note 1) This tool is recommended for finish machining only.

Note 2) Air blow or oil mist is recommended for good chip evacuation.

Note 3) Note the following points when using the tools.

- Avoid using equipment abruptly without proper preparation. After sufficient warming up of equipment, ensure that there will be no changes to the depth of cut such as due to elongation of the main axis during machining.
- If the tools are used immediately after rough machining of a surface, large uneven areas (cusp heights) will cause deflection of the tools and waviness of the machined surface. Therefore, it is recommended to add a medium finish machining process which uses the same value of a_e as indicated in the table above.

Note 4) α is the inclination angle of the machined surface.

Depth of cut

Note 1) When the inclination angle of machined surface is large, or machining with large cutting load such as in corners, reduce the revolution and feed rate.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) Cutting conditions may differ considerably due to the tool overhang, depth of cut and machine tool condition. Please use the table above as a reference starting point.

VFRPSRB NEW

Corner radius end mill, Short cut length, High precision, 4 flute

CARBIDE

Depth of Cut

Note 1) The cutting conditions above are a guide only to machining with cutting edges with a corner radius. When machining with peripheral cutting edges, use the minimum feed rate as a guide.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.

Note 4) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

DC: Dia.

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut		
--------------	---	---

DC: Dia.

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut						

DC: Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

RE:Radius

- Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.
- Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.
- Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
- Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.
- Note 5) α is the inclination angle of the machined surface.

Depth of cut

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.

Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.

In these cases the feed and speed should be reduced proportionately.

Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

Side milling

When machine and work material rigidity and chip discharge properties are sufficient, please select the high efficiency cutting conditions.
When machine rigidity, work material rigidity or chip discharge properties are insufficient, please select general-purpose cutting conditions.

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.
When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.
In these cases the feed and speed should be reduced proportionately.

VQMZHVOH

Depth of cut

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.

Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.

In these cases the feed and speed should be reduced proportionately.

Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

Side milling

When machine and work material rigidity and chip discharge properties are sufficient, please select the high efficiency cutting conditions.
When machine rigidity, work material rigidity or chip discharge properties are insufficient, please select general-purpose cutting conditions.

DC:Dia.

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.

Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.

In these cases the feed and speed should be reduced proportionately.

Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

20	160	2500	970	50	2	40	640	80	50	0.4

Depth of cut

- Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.
- Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.
- Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
- Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

Depth of cut											

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.

Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.

In these cases the feed and speed should be reduced proportionately.

20	3200	1400	2400	900
Depth of cut				

DC: Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is very low, then vibration can occur.

In this case, please reduce the revolution and feed rate proportionately.

VQMHV RB

Corner radius end mill, Medium cut length, Irregular helix, 4 flute.

ROUGHING

- Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.
When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.
- Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.
- Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.
In these cases the feed and speed should be reduced proportionately.
- Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

Depth of cut

DC: Dia.

- Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.
- Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.
- Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
- Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

Depth of cut											

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) When cutting titanium alloys, the use of water-soluble cutting fluid is effective.

Note 3) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is very low, then vibration can occur.

In this case, please reduce the revolution and feed rate proportionately.

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) When cutting titanium alloys, the use of water-soluble cutting fluid is effective.

Note 3) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the work material installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.

Note 4) If the depth of cut is smaller, the revolution and the feed rate can be increased.

Note 5) For slot milling, use a chuck with high clamping force.

Depth of cut

Note 1) VQ coating has less electrical conductivity; therefore an external contact type (electrically transmitted) tool setter may not work.

When measuring the tool length, please use an internal contact type (non-electrical type) tool setter or a laser type tool setter.

Note 2) Effective cutting of stainless steel, titanium alloys and heat-resistant alloys etc. can be achieved with the use of emulsion coolant.

Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.

In these cases the feed and speed should be reduced proportionately.

Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

■ Slotting

When machine and work material rigidity and chip discharge properties are sufficient, please select the high efficiency cutting conditions.
 When machine rigidity, work material rigidity or chip discharge properties are insufficient, please select general-purpose cutting conditions.

Depth of cut

RE:Radius

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Water-soluble cutting fluid is recommended.

Note 3) Cutting conditions may be considerably different due to the overhang (milling depth), depth of cut, and machine tool. Please see the above table as a standard.

RECOMMENDED CUTTING CONDITIONS

Work material	N		
	Aluminium alloy		
	Dia. DC (mm)	Revolution (min ⁻¹)	Feed rate (mm/min)
Side milling			Slotting
3	40000	1800	1600
4	36000	2400	2100
5	30000	3000	2700
6	27000	3200	2800
8	20000	3400	3000
10	16000	3600	3200
12	13000	3600	3200
16	10000	3600	3200
20	8000	3300	3000

Depth of cut			DC: Dia.
--------------	--	--	----------

Note 1) This table shows the cutting condition with less than 4DC overhang length. If more than 4DC, spindle speed, feed rate and depth of cut should be reduced.

Note 2) If the rigidity of the machine or the workpiece installation is very low, or chattering and noise are generated, please reduce the revolution and the feed rate proportionately.

Note 3) Water-soluble cutting fluid is recommended.

Note 4) Climb cutting is recommended for side milling.

25	600	7600	7300	12.5

Depth of Cut  DC:Cutting Dia.

Note 1) It is recommended to use a water-soluble coolant. It is also possible to use an air blower (outer/inner) for DLC coating.

Note 2) Climb milling is recommended for side cutting.

Note 3) This table shows the cutting condition with less than 4D overhang length. If more than 4D, spindle speed, feed rate and depth of cut should be reduced.

Note 4) When ramping, consider the chip discharge and reduce the feed rate of the slotting conditions by 50% and use a ramping angle of 5° or less.

Note 5) If the rigidity of the machine or the workpiece materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately within the range described in the above table, or reduce the depth and width of cut.

Depth of cut	ae		DC	
				

Note 1) Water-soluble cutting fluid is recommended.

Note 2) Climb milling is recommended for side cutting.

Note 3) When machining with a large tool length protrusion, adjust the the speed, feed and depth of cut as necessary.

Note 4) If the rigidity of the machine or the workpiece materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately within the range described in the above table, or reduce the depth and width of cut.

Depth of cut

Note 1) When high machining accuracy is needed, or the work materials becomes chipped, we recommend lowering the feed rate.

Note 2) Use a milling machine suitable for graphite machining.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Note 4) When dry machining work materials that contain resin, beware build up of chips that may cause breakage.

Depth of cut 

- Note 1) The carbide material in the cutting conditions table above is based on CIS standard VM-40(90HRA).
- Note 2) Air blow or dry processing is recommended for milling carbide material. Note: Using coolant or oil mist may decrease tool longevity.
- Note 3) The use of a water soluble cutting oil is recommended with the processing of hard brittle materials other than the carbide mentioned in the above table. Be sure to remove any chip discharge that adheres to the tool.
- Note 4) Cutting conditions may need adjusting depending on the type of material.
- Note 5) If the rigidity of the machine or work clamping is low, or chattering or noise is generated, reduce the feed and speed proportionately.
- Note 6) Implementation of special countermeasures is recommended since fine chip discharge may penetrate the machine tool mechanism.

Note 1) Supply cutting fluid sufficiently during slotting. When dry cut, slotting decrease the revolution and feed rate by 20–30% proportionately.

Note 2) When drilling, please reduce the feed rate by 65%.

Note 3) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

SYMBOL DESCRIPTIONS

Tool Material

Ultra micro grain carbide
Ultra micro grain carbide is used as the substrate material.

Angle, Coolant hole, Sharp corner edge and Gash land

Helix angle
Indicates the helix angle of the end mill.

End cutting edge with coolant hole

Peripheral cutting edge with coolant hole

Gash land
Indicates the end mill cutting edge has a gash land.

Tolerances

Outside diameter tolerance
Indicates diameter tolerance of end mill.

R tolerance
Indicates the radial tolerance of a ball nose end mill.

R tolerance
Indicates the radial tolerance of an end mill with a corner radius.

Tolerance of point diameter
Indicates the tolerance of the point diameter.

Correction factor by overhang length (Shoulder Milling)

Use by multiplying the recommended cutting condition by the correction factor of the overhang length.
Refer to each recommended condition for the long cutting edge and offset type.

Diagram illustrating the cutting parameters: ae (Cutting Width) and ap (Depth of Cut).

Note 1) For stainless steel, titanium and heat resistant alloys, the use of water-soluble coolant is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

RECOMMENDED CUTTING CONDITIONS

■ Shoulder milling (L/D=3)

Other than the L/D = 3, use following recommended cutting conditions by multiplying the J003 page correction factor of the overhang length.

Work material	P						N						P						M			S		
	Carbon steel, Alloy steel, Mild Steel, Copper, Copper alloys												Pre-hardened steel, Carbon steel, Alloy steel, Alloy tool steel						Austenitic stainless steel, Ferritic and martensitic stainless steel, Titanium alloy

Diagram illustrating the cutting parameters: ae (Cutting Width) and ap (Depth of Cut).

Note 1) For stainless steel, titanium and heat resistant alloys, the use of water-soluble coolant is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

	32	24	240	0.05	48	32	0.6	-	-	-	-	-	-
Depth of cut													

Note 1) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Diagram illustrating the cutting parameters for slot milling: DC (Diameter) and ap (Depth of Cut).

DC: Dia.

Note 1) Vibration may occur if the rigidity of machine or workpiece is low. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) For stainless steel, titanium alloy, the use of water-soluble coolant is effective.

Note 1) For stainless steel, titanium and heat resistant alloys, the use of water-soluble coolant is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Note 4) α is the inclination angle of the machined surface.

Depth of cut

Note 1) For stainless steel, titanium and heat resistant alloys, the use of water-soluble coolant is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

	32	24	240	0.05	48	32	0.6	-	-	-	-	-	-
Depth of cut													

Note 1) For stainless steel, titanium and heat resistant alloys, the use of water-soluble coolant is effective.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut 

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 2) Air blow or oil mist is recommended for good chip evacuation.

Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.

Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills.

However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.

In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Note 1) The fastening size of the holder and head should be the same. (refer to Page J002.)

INDEXABLE HEAD END MILLS

HOW TO INSTALL THE HEAD

- 1 Using a clean cloth, wipe away oil and dust from the taper and end surfaces of the head and holder.

- 2 Be careful to avoid the possibility of injury when fastening with bare hands. Securely fasten the head and holder end surfaces using the enclosed wrench to close any remaining gap.

- 3 Refer to the table at below regarding angles for recommended torque when necessary. For precise usage, refer to the table below for torque wrench settings.

Suitable Head	Reference tightening angle α	Recommended clamping torque (Nm)
IMX10[]	50°	10
IMX12[]	50°	15
IMX16[]	50°	30
IMX20[]	40°	50
IMX25[]	35°	75

Note 1) Use the enclosed wrench only.
(Standard wrenches may be too thick)

HOW TO SELECT IMX HOLDERS

- When using straight holder + standard head, interference will occur in cases where the depth of cut is larger than the length of cut of the head.
- When using straight holder + offset head, larger depths of cut are possible because the diameter of the head is larger than the holder.

Straight + Standard head

Less than $DC \times 3$ overhang is recommended when depth of cut < length of cut.

- Undercut type with relieved neck is suitable for vertical wall machining.
- The large diameter of the taper neck holder provides stability in long overhang applications.
- Undercut and taper neck types are now also available. (Please refer to diameter DC of each type for minimum diameter.)

Undercut + Standard head

Straight + Offset head

Taper neck + Standard head

Memo

A series of horizontal dashed lines for writing, spanning the width of the page.

FORMULAE FOR END MILLS

P

TECHNICAL DATA

CUTTING SPEED (Vc)

$$V_c = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

Vc (m/min) : Cutting Speed
 π (3.14) : Pi

DC(mm) : Cutter Diameter
 n (min⁻¹) : Main Axis Spindle Speed

* Divide by 1000 to change to m from mm.

(Example) What is the cutting speed when the main axis spindle speed is 1900min⁻¹ and the cutter diameter is ϕ 20mm ?

(Answer) Substitute $\pi=3.14$, DC=20, n=1900 into the formula.

$$V_c = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \cdot 20 \cdot 1900}{1000} = 120 \text{ m/min}$$

The cutting speed is 120m/min.

TABLE FEED (Vf)

$$V_f = f_z \cdot z \cdot n \text{ (mm/min)}$$

Vf (mm/min) : Table Feed per Min.

z : Number of flutes

fz (mm/t.) : Feed per Tooth

n (min⁻¹) : Main Axis Spindle Speed

(Example) What is the table feed when feed per tooth is 0.07 mm/t, the number of flutes is 4, and the main axis spindle speed is 1900min⁻¹?

(Answer) Substitute the above figures into the formula.

$$V_f = f_z \cdot z \cdot n = 0.07 \cdot 4 \cdot 1900 = 540 \text{ mm/min}$$

The table feed is 540 mm/min.

CUTTING TIME (Tc)

$$T_c = \frac{L}{V_f} \text{ (min)}$$

Tc (min) : Cutting Time

Vf (mm/min) : Table Feed per Min.

L (mm) : Total Table Feed Length (Workpiece Length: I+Cutter Diameter:DC)

(Example) What is the cutting time required for slotting 20 mm width and 300 mm length surface of a cast iron (GG20) block when the cutter diameter is ϕ 20mm, the number of flutes is 4, the cutting speed is 120m/min, and feed per tooth is 0.07 mm/t. (spindle speed is 1900min⁻¹).

(Answer) Calculate table feed per min Vf=0.07•4• 1900= 540 mm/min
 Calculate total table feed length. L=300+20= 320 mm
 Substitute the above answers into the formula.

$$T_c = \frac{L}{V_f} = \frac{320}{540} = 0.592 \text{ m/min}$$

0.592•60= 35.5 (sec). The answer is 35.5 sec.

■ CUTTING POWER (Pc)

$$P_c = \frac{a_p \cdot a_e \cdot V_f \cdot K_c}{60 \times 10^6 \cdot \eta}$$

P_c (kW) : Actual Cutting Power
a_e (mm) : Cutting Width
K_c (MPa) : Specific Cutting Force

a_p (mm) : Depth of Cut
V_f (mm/min) : Table Feed per Min.
η : (Machine Coefficient)

(Example) What is the cutting power required for milling tool steel at a cutting speed of 80m/min. With depth of cut 2mm, cutting width 80mm, and table feed 280mm/min by $\phi 250$ cutter with 12 inserts. Machine coefficient 80%.

(Answer) First, calculate the spindle speed in order to obtain the feed per tooth.

$$n = \frac{1000V_c}{\pi DC} = \frac{1000 \times 80}{3.14 \times 250} = 101.91 \text{ min}^{-1}$$

$$\text{Feed per Tooth } fz = \frac{V_f}{z \times n} = \frac{280}{12 \times 101.9} = 0.228 \text{ mm/t.}$$

Substitute the specific cutting force into the formula.

$$P_c = \frac{2 \times 80 \times 280 \times 1800}{60 \times 10^6 \times 0.8} = 1.68 \text{ kW}$$

TECHNICAL DATA

■ COMPARISON OF SECTIONAL SHAPE AREA OF CHIP POCKET

■ CHARACTERISTICS AND APPLICATIONS OF DIFFERENT-NUMBER-OF-FLUTE END MILLS

	2-flutes	3-flutes	4-flutes	6-flutes
Feature	Advantage	Chip disposability is excellent. Suitable for sinking. Drilling is easy.	Chip disposability is excellent. Suitable for sinking.	High rigidity. Superior cutting edge durability.
	Fault	Low rigidity	Diameter is not measured easily.	Chip disposability is poor.
Usage	Slotting, side milling, sinking. Wide range of use.	Slotting, side milling Heavy cutting, finishing	Shallow slotting, side milling Finishing	High Hardness Material Shallow slotting, side milling

END MILL FEATURES AND SPECIFICATION

P

TECHNICAL DATA

■ Peripheral Cutting Edge

Type	Shape	Feature
Ordinary Flute		Regular flute geometry as shown is most commonly used for roughing and finishing of side milling, slotting and shoulder milling.
Tapered Flute		A tapered flute geometry is used for special applications such as mould drafts and for applying taper angles after conventional straight edged milling.
Roughing Flute		Roughing type geometry has a wave like edge form and breaks the material into small chips. Additionally the cutting resistance is low enabling high feed rates when roughing. The inside face of the flute is suitable for regrinding.
Formed Flute		Special form geometry as shown is used for producing corner radii on components. There are an infinite number of different geometries that can be manufactured using such style of cutters.

■ End Cutting Edge

Type	Shape	Feature
Square End (With Centre Hole)		Generally used for side milling, slotting and shoulder milling. Plunge cutting is not possible due to the centre hole that is used to ensure accurate grinding and regrinding of the tool.
Square End (Centre Cut)		Generally used for side milling, slotting and shoulder milling. Plunge cutting is possible and greater plunge cutting efficiency is obtained when using fewer flutes. Regrinding on the flank face can be done.
Ball End		Geometry completely suited for curved surface milling. At the extreme end point the chip pocket is very small leading to inefficient chip evacuation.
Corner Radius End		Used for radius profiling and corner radius milling. When pick feed milling an end mill with a large diameter and small corner radius can be used efficiently.

■ Shank And Neck Parts

Type	Shape	Feature
Standard (Straight Shank)		Most widely used type.
Long Shank		Long shank type for deep pocket and shoulder applications.
Long Neck		Long neck geometry can be used for deep slotting and is also suitable for boring.
Taper Neck		Long taper neck features are best utilised on deep slotting and mould draft applications.

PITCH SELECTION OF PICK FEED

■ PICK FEED MILLING (CONTOURING) WITH BALL NOSE END MILLS AND END MILLS WITH CORNER RADII

$$h = R \cdot \left[1 - \cos \left\{ \sin^{-1} \left(\frac{ae}{2R} \right) \right\} \right]$$

R : Radius of Ball Nose(RE), Corner Radius(RE)

ae : Pick Feed

h : Cusp Height

■ CORNER R OF END MILLS AND CUSP HEIGHT BY PICK FEED

Unit : mm

SURFACE ROUGHNESS

SURFACE ROUGHNESS

(From JIS B 0601-1994)

TECHNICAL DATA

Type	Code	Determination	Determination Example (Figure)
Arithmetical Mean Roughness	Ra	<p>Ra means the value obtained by the following formula and expressed in micrometer (μm) when sampling only the reference length from the roughness curve in the direction of the mean line, taking X-axis in the direction of mean line and Y-axis in the direction of longitudinal magnification of this sampled part and the roughness curve is expressed by $y=f(x)$:</p> $Ra = \frac{1}{l} \int_0^l f(x) dx$	
Maximum Height	Rz	<p>Rz shall be that only when the reference length is sampled from the roughness curve in the direction of the mean line, the distance between the top profile peak line and the bottom profile valley line on this sampled portion is measured in the longitudinal magnification direction of roughness curve and the obtained value is expressed in micrometer (μm).</p> <p>Note) When finding Rz, a portion without an exceptionally high peak or low valley, which may be regarded as a flaw, is selected as the sampling length.</p> $Rz = R_p + R_v$	
Ten-Point Mean Roughness	RzJIS	<p>RzJIS shall be that only when the reference length is sampled from the roughness curve in the direction of its mean line, the sum of the average value of absolute values of the heights of five highest profile peaks (Y_p) and the depths of five deepest profile valleys (Y_v) measured in the vertical magnification direction from the mean line of this sampled portion and this sum is expressed in micrometer (μm).</p> $Rz_{JIS} = \frac{(Y_{p1} + Y_{p2} + Y_{p3} + Y_{p4} + Y_{p5}) + (Y_{v1} + Y_{v2} + Y_{v3} + Y_{v4} + Y_{v5})}{5}$	<p>$Y_{p1}, Y_{p2}, Y_{p3}, Y_{p4}, Y_{p5}$: altitudes of the five highest profile peaks of the sampled portion corresponding to the reference length l.</p> <p>$Y_{v1}, Y_{v2}, Y_{v3}, Y_{v4}, Y_{v5}$: altitudes of the five deepest profile valleys of the sampled portion corresponding to the reference length l.</p>

RELATIONSHIP BETWEEN ARITHMETICAL MEAN (Ra) AND CONVENTIONAL DESIGNATION (REFERENCE DATA)

Arithmetical Mean Roughness Ra		Max. Height Rz	Ten-Point Mean Roughness RzJIS	Sampling Length for Rz • RzJIS l (mm)	Conventional Finish Mark
Standard Series	Cutoff Value λ_c (mm)	Standard Series			
0.012 a	0.08	0.05s	0.05z	0.08	▽▽▽▽
0.025 a		0.1 s	0.1 z		
0.05 a	0.25	0.2 s	0.2 z	0.25	
0.1 a		0.4 s	0.4 z		
0.2 a		0.8 s	0.8 z		
0.4 a	0.8	1.6 s	1.6 z	0.8	▽▽▽
0.8 a		3.2 s	3.2 z		
1.6 a		6.3 s	6.3 z		
3.2 a		12.5 s	12.5 z		
6.3 a	2.5	25 s	25 z	2.5	▽▽
12.5 a		50 s	50 z		
25 a	8	100 s	100 z	8	▽
50 a		200 s	200 z		
100 a		400 s	400 z		

*The correlation among the three is shown for convenience and is not exact.

*Ra: The evaluation length of Rz and RzJIS is the cutoff value and sampling length multiplied by 5, respectively.

WORLDWIDE

MITSUBISHI MATERIALS CORPORATION - METALWORKING SOLUTIONS COMPANY A SYNERGY FOR SUCCESS

The Metalworking Solutions division of Mitsubishi Materials is dedicated to the development and processing of metals, cutting materials, coatings and precision tools. Profound know-how and many years of experience in manufacturing technology makes Mitsubishi Materials one of the leading suppliers in the precision cutting tool market.

The company's global market presence, with headquarters and sales offices in Japan, Europe, India, Brazil, China, Thailand, Mexico and the US, as well as a broad network of international distributors, ensures a targeted, comprehensive service.

Information exchange and technology transfer, open communication and growing synergies guarantee maximum performance and sustainable customer success.
